

Protection of Electricity Distribution Networks - 2nd Edition

Juan M. Gers and Edward J. Holmes

The Institution of Electrical Engineers

Contents

Preface and acknowledgements	xi
Preface to 2nd edition	xiii
1 Introduction	1
1.1 General	1
1.2 Basic principles of electrical systems	3
1.3 Protection requirements	3
1.4 Protection zones	5
1.5 Primary and back-up protection	5
1.5.1 Primary protection	5
1.5.2 Back-up protection	5
1.6 Directional protection	7
1.7 Exercise 1.1	9
2 Calculation of short-circuit currents	11
2.1 Modelling for short-circuit current calculations	11
2.1.1 Effect of the system impedance	11
2.1.2 Effect of rotating machinery	13
2.1.3 Types of fault duty	14
2.1.4 Calculation of fault duty values	16
2.2 Methods for calculating short-circuit currents	19
2.2.1 Importance and construction of sequence networks	22
2.2.2 Calculation of asymmetrical faults using symmetrical components	23
2.2.3 Equivalent impedances for a power system	26
2.3 Supplying the current and voltage signals to protection systems	26
2.4 Calculation of faults by computer	28
3 Classification and function of relays	31
3.1 Classification	31
3.1.1 Construction	31

3.1.2	Incoming signal	31
3.1.3	Function	32
3.1.4	International identification of electrical devices	32
3.2	Electromechanical relays	33
3.2.1	Attraction relays	33
3.2.2	Relays with moveable coils	34
3.2.3	Induction relays	35
3.3	Evolution of protection relays	38
3.4	Numerical protection	39
3.4.1	General	39
3.4.2	Characteristics of numerical relays	39
3.4.3	Typical architectures of numerical relays	40
3.4.4	Standard functions of numerical relays	41
3.5	Supplies to the relay circuits	43
4	Current and voltage transformers	45
4.1	Voltage transformers	45
4.1.1	Equivalent circuit	45
4.1.2	Errors	46
4.1.3	Burden	47
4.1.4	Selection of VTs	47
4.1.5	Capacitor voltage transformers	47
4.2	Current transformers	51
4.2.1	Equivalent circuit	51
4.2.2	Errors	52
4.2.3	AC saturation	52
4.2.4	Burden	53
4.2.5	Selection of CTs	53
4.2.6	DC saturation	59
4.2.7	Precautions when working with CTs	59
5	Overcurrent protection	63
5.1	General	63
5.2	Types of overcurrent relay	63
5.2.1	Definite-current relays	63
5.2.2	Definite-time/current or definite-time relays	66
5.2.3	Inverse-time relays	66
5.3	Setting overcurrent relays	66
5.3.1	Setting instantaneous units	67
5.3.2	Coverage of instantaneous units protecting lines between substations	68
5.3.3	Setting the parameters of time delay overcurrent relays	70

5.4	Constraints of relay co-ordination	73
5.4.1	Minimum short-circuit levels	73
5.4.2	Thermal limits	73
5.4.3	Pick-up values	75
5.5	Co-ordination across Dy transformers	86
5.6	Co-ordination with fuses	96
5.7	Co-ordination of negative-sequence units	96
5.8	Overcurrent relays with voltage control	97
5.9	Setting overcurrent relays using software techniques	98
5.10	Use of digital logic in numerical relaying	99
5.10.1	General	99
5.10.2	Principles of digital logic	99
5.10.3	Logic schemes	100
5.11	Adaptive protection with group settings change	102
5.12	Exercises	104
6	Fuses, reclosers and sectionalisers	109
6.1	Equipment	109
6.1.1	Reclosers	109
6.1.2	Sectionalisers	113
6.1.3	Fuses	114
6.2	Criteria for co-ordination of time/current devices in distribution systems	117
6.2.1	Fuse-fuse co-ordination	117
6.2.2	Recloser-fuse co-ordination	117
6.2.3	Recloser-recloser co-ordination	120
6.2.4	Recloser-relay co-ordination	122
6.2.5	Recloser-sectionaliser co-ordination	123
6.2.6	Recloser-sectionaliser-fuse co-ordination	123
7	Directional overcurrent relays	127
7.1	Construction	127
7.2	Principle of operation	128
7.3	Relay connections	128
7.3.1	30° connection (0° AMT)	129
7.3.2	60° connection (0° AMT)	129
7.3.3	90° connection (30° AMT)	130
7.3.4	90° connection (45° AMT)	131
7.4	Directional earth-fault relays	131
7.5	Co-ordination of instantaneous units	137
7.6	Setting of time-delay directional overcurrent units	141
7.6.1	Pick-up setting	141
7.6.2	Time dial setting	142
7.7	Exercises	146

8	Differential protection	149
8.1	General	149
8.2	Classification of differential protection	152
8.3	Transformer differential protection	152
8.3.1	Basic considerations	153
8.3.2	Selection and connection of CTs	154
8.3.3	Percentage of winding protected by the differential relay during an earth fault	159
8.3.4	Determination of the slope	161
8.3.5	Distribution of fault current in power transformers	162
8.4	Differential protection for generators and rotating machines	164
8.5	Line differential protection	164
8.6	Busbar differential protection	168
8.6.1	Differential system with multiple restraint	168
8.6.2	High impedance differential system	169
8.7	Exercises	170
9	Distance protection	173
9.1	General	173
9.2	Types of distance relays	174
9.2.1	Impedance relay	176
9.2.2	Directional relay	179
9.2.3	Reactance relay	180
9.2.4	Mho relay	181
9.2.5	Completely polarised mho relay	182
9.2.6	Relays with lens characteristics	183
9.2.7	Relays with polygonal characteristics	183
9.2.8	Relays with combined characteristics	185
9.3	Setting the reach and operating time of distance relays	185
9.4	The effect of infeeds on distance relays	188
9.5	The effect of arc resistance on distance protection	193
9.6	Residual compensation	194
9.7	Impedances seen by distance relays	195
9.7.1	Phase units	195
9.7.2	Earth-fault units	196
9.8	Power system oscillations	196
9.9	The effective cover of distance relays	199
9.10	Maximum load check	200
9.11	Drawing relay settings	203
9.12	Intertripping schemes	212
9.12.1	Under reach with direct tripping	213
9.12.2	Permissive under reach intertripping	213
9.12.3	Permissive over reach intertripping	214
9.13	Distance relays on series-compensated lines	214

9.14	Technical considerations of distance protection in tee circuits	215
9.14.1	Tee connection with infeeds at two terminals	215
9.14.2	Tee connection with infeeds at all three terminals	218
9.15	Use of distance relays for the detection of the loss of excitation in generators	219
9.16	Exercises	222
10	Protection of industrial systems	225
10.1	Protection devices	225
10.1.1	Overcurrent relays	225
10.1.2	Direct acting devices in power and moulded-case circuit breakers	225
10.1.3	Combined thermal relay contactor and fuse	226
10.2	Criteria for setting overcurrent protection devices associated with motors	226
10.2.1	Thermal relays	226
10.2.2	Low voltage breakers	227
11	Industrial plant load shedding	239
11.1	Power system operation after loss of generation	239
11.2	Design of an automatic load shedding system	240
11.2.1	Simple machine model	240
11.2.2	Parameters for implementing a load shedding system	241
11.3	Criteria for setting frequency relays	242
11.3.1	Operating times	242
11.3.2	Determination of the frequency variation	243
11.4	Example of calculating and setting frequency relays in an industrial plant	243
11.4.1	Calculation of overload	243
11.4.2	Load to be shed	243
11.4.3	Frequency levels	243
11.4.4	Load shedding stages	243
11.4.5	Determination of the frequency relay settings	244
11.4.6	Verification of operation	247
12	Protection schemes and substation design diagrams	251
12.1	Protection schemes	251
12.1.1	Generator protection	251
12.1.2	Motor protection	252
12.1.3	Transformer protection	258
12.1.4	Line protection	261
12.2	Substation design diagrams	261
12.2.1	Single-line diagrams	262
12.2.2	Substation layout diagrams	263

12.2.3	Diagrams of AC connections	264
12.2.4	Diagrams of DC connections	265
12.2.5	Wiring diagrams	266
12.2.6	Logic diagrams	268
12.2.7	Cabling lists	268
13	Processing alarms	269
13.1	General	269
13.2	Alarm processing methods	270
13.3	Expert systems	271
13.4	Equivalent alarms	272
13.5	Rules	273
13.6	Finger printing approach	273
13.7	Hypothesis approach	275
14	Installation, testing and maintenance of protection systems	283
14.1	Installation of protection equipment	283
14.2	Testing protection schemes	285
14.2.1	Factory tests	285
14.2.2	Precommissioning tests	285
14.2.3	Periodic maintenance	290
14.3	Commissioning numerical protection	292
14.3.1	Setting the parameters	292
14.3.2	Performance tests	293
	Bibliography	297
	Appendix: Solutions to exercises	301
	Index	339
